Association of central venous saturation and serum lactate with outcomes in veno-arterial extracorporeal membrane oxygenation

We read with great interest the study by Chen et al. in which they evaluated the association of central venous saturation and serum lactate at various time points with the prognosis of patients requiring veno-arterial extracorporeal membrane oxygenation. The study concluded that serum lactate at 12–24 h after the initiation of extracorporeal membrane oxygenation ¹.

While the patient is in the intensive care unit, being able to identify whether the patient is at a higher risk or having a poor outcome is helpful at any point in time. Such identification promotes greater situational awareness and helps facilitate more efficient resource allocation. Thus, we applaud the authors for their efforts. However, this study has some major limitations.

First, the central venous saturation utilized in the study was not well described. What access point located where were venous saturations drawn from? This is important, as there are differences in the prognostic capabilities of regional venous saturations drawn from different locations ².

Second, regardless of where the venous saturation was drawn from, there is an inherent limitation in this study’s design to investigate venous saturation’s association with outcomes because the extracorporeal membrane oxygenation strategy described altered the flow to maintain a minimum venous saturation. This means that venous saturation was maintained above a lower threshold at all time points, except for perhaps the initial time point (T0). This, at the very least, decreases the range in values.
This decrease in range in venous saturation values due to the maintenance of a minimum venous saturation, while on extracorporeal membrane oxygenation, then leads to the next issue that relates to statistical power. As frequentist statistics were utilized in the study, the analyses are susceptible to the effects of the sample size in detecting the effects of various sizes. The differences in serum lactate were greater than the differences in venous saturation between the groups at most times, specifically at the initial time points. This means that the same sample size would allow for the detection of only comparatively larger effect sizes for central venous saturation than for serum lactate. For instance, in the successful versus unsuccessful weaning at T1, there is a mean difference of 0.6 between the two groups. To detect a difference with a power of 80% at p-value <0.05, approximately 2,610 patients in the unsuccessful weaning group and 5,220 patients in the successful weaning group would be required. The same limitation may apply to other variables of interest, particularly flow.

Finally, another issue lies in the description of the statistical analyses, specifically surrounding the multivariable regression. The regression is described as being “multivariate,” which implies multiple dependent variables that do not appear to be the case. It appears that the authors utilized a “multivariable” regression in which there is a single dependent variable and multiple independent variables. Beyond saying that regression was done, there was no description of how variables were selected for entry into the regression. This is important because the entry of each serum lactate and central venous saturation for each time point would greatly restrict the power of the regression analysis to detect statistically significant differences.

AUTHORSHIP &
CONFLICTS OF INTEREST STATEMENT

Manuscript title (please type):
Association of central venous saturation and serum lactate with outcomes in veno-arterial extracorporeal membrane oxygenation

AUTHORSHIP
All persons who meet authorship criteria are listed as authors, and all authors certify that they have participated sufficiently in the work to take public responsibility for the content, including participation in the concept, design, analysis, writing, or revision of the manuscript. Furthermore, each author certifies that this material or similar material has not been and will not be submitted to or published in any other publication.

Indicate the specific contributions made by each author (list the authors’ initials followed by their surnames, e.g., Y.L. Chang). The name of each author must appear at least once in each of the three categories below.

Category 1
Conception and design of study (typed): Enrique G. Villarreal, Saul Flores;
acquisition of data (typed): _________________________;
analysis and/or interpretation of data (typed): _________________________.

Category 2
Drafting the manuscript (typed): Rohit S. Loomba, Juan S. Farias;
revising the manuscript critically for important intellectual content (typed): _________________________.

Category 3
Approval of the version of the manuscript to be published (names of all authors must be typed below):
Enrique G. Villarreal, Saul Flores, Rohit S. Loomba, Juan S. Farias, ________________.

Acknowledgments
All persons who have made substantial contributions to the work reported in the manuscript (e.g., technical help, writing and editing assistance, general support), but who do not meet the criteria for authorship, are named in the Acknowledgments and have given us their written permission to be named. If we have not included an Acknowledgments, then that indicates that we have not received substantial contributions from non-authors.
CONFLICTS OF INTEREST
A conflict of interest occurs when an individual’s objectivity is potentially compromised by a desire for financial gain, prominence, professional advancement or a successful outcome. PEDN Editors strive to ensure that what is published in the Journal is as balanced, objective and evidence-based as possible. Since it can be difficult to distinguish between an actual conflict of interest and a perceived conflict of interest, the Journal requires authors to disclose all and any potential conflicts of interest.

Section I
The authors whose names are listed immediately below certify that they have NO affiliations with or involvement in any organization or entity with any financial interest (such as honoraria; educational grants; participation in speakers’ bureaus; membership, employment, consultancies, stock ownership, or other equity interest; and expert testimony or patent-licensing arrangements), or non-financial interest (such as personal or professional relationships, affiliations, knowledge or beliefs) in the subject matter or materials discussed in this manuscript.
